

## Maturity Models 101

Based on the paper "A Primer for Applying Maturity Models to Smart Grid Security, Resilience, and Interoperability"

> by Richard Caralli, Software Engineering Institute Mark Knight, CGI and GWAC Member Austin Montgomery, Software Engineering Institute

Software Engineering Institute Carnegie Mellon

## Smart Grid Drivers

- Smart Grid is relevant to the entire energy infrastructure from generation to consumption.
- The nature of connectivity of devices and systems in smart grid applications requires the alignment of many stakeholders.
- Given the great number of parties involved, efforts are progressing to provide an open, standards based, framework for the integration of devices and services.
- Includes both technical and cognitive abilities.
- Must optimize technical, social, political, and organizational factors that impact system to system performance across multiple parties

"IEEE PES ISGT 2013, Maturity Model for Advancing Smart Grid Interoperability", Knight Widergrein Hater Wontgomery 2

# What is a Maturity Model

- In its simplest form, a maturity model is a set of characteristics, attributes, indicators, or patterns that represent progression and achievement in a particular domain or discipline.
- Architecturally, maturity models typically have "levels" along an evolutionary scale that defines measurable transitions from one level to another.
- Having measurable transition states between the levels enables an organization to use the scaling to
  - define its current state
  - determine its future, more "mature" state
  - identify the attributes it must attain to reach that future state
- For a maturity model to be effective and have impact, the "measurable transitions" between levels should be based on empirical data that has been validated in practice.

## The Evolutionary Process

# Benefits of Maturity Models

- Benchmark internal performance
  - organizations can determine where they are in their improvement journey and set targets for future investments in performance improvement
- Catalyze performance improvement
  - over a period of time, organizations can use the model as the basis for continuous performance improvement
- Catalyze improvements in community performance
  - organizations can not only compare their performance against peer organizations but also determine a "community" performance profile
- Create and evolve a common language
  - create a consistent way of thinking and communicating about a domain that is embodied in model language or taxonomy

## Types of Models - Progression

## Types of Models - Capability

ad hoc  $\longrightarrow$  managed  $\longrightarrow$  defined  $\longrightarrow$  quantitatively managed  $\longrightarrow$  optimized Grid-Interop 2

# Types of Models - Hybrid

Useful for focusing on specific subject matter to assess maturity from the perspective of how well standards & best practices have been included into an organization's capabilities.

### Types of Models - Capability

## **Essential Components**

- Levels
  - may describe a progressive step or plateau, or an expression of capability or other attribute that can be measured by the model
- Model Domains
  - a means for grouping like attributes into an area of importance for the subject matter
- Attributes
  - typically based on observed practice, standards, or other expert knowledge
- Appraisal and Scoring Methods
  - developed to facilitate assessment using the model to ensure consistency of appraisals and a common standard for measurement
- Improvement Roadmaps
  - prescribed methods for identifying an improvement scope, diagnosing current state, and then planning and implementing improvement and verifying that it has occurred

#### SG-IMM

#### An Introduction to the GWAC Smart Grid Interoperability Maturity Model

# Agenda

- What is a Maturity Model?
- What is Interoperability?
- What Domains, Attributes, or Framework can we use to assess maturity?
- The structure of the SG-IMM

#### What is "Fast"?

# What is Interoperability?

- Interoperability is a measurable property of diverse entities that allows them to work together across technical, social, political, and organizational boundaries.
- Higher levels of interoperability maturity among diverse entities results in lower integration costs, faster connection of the entities and fewer operating problems once connected and communicating.
- "The capability of two or more networks, systems, devices, applications, or components to exchange information between them and to use the information so exchanged"
  - Interop framework, referenced from "EICTA Interoperability White Paper", European Industry Association, Information Systems Communication Technologies Consumer Electronics, 21 June 2004.

## Interoperability Maturity Model

- The Smart Grid Interoperability Maturity Model (SG-IMM) provides <u>a measurable model for determining the interoperability</u> <u>capabilities of the interfaces between various entities in the</u> <u>electric power system</u>.
- It is a crucial step towards defining metrics for determining the current quality and levels of interoperability among interacting entities.
- It identifies areas for improvement and provides a roadmap for how to make incremental improvements in the interface, and standards and their application (if applicable).
- Interface
  - (n) a common boundary or interconnection between systems, equipment, concepts, or human beings

**Grid-Interop** 

– (v) to bring together; connect or mesh

### The Path Is a Spiral

#### A Maturity Model for Interoperability

- Interoperability questions for a community/ecosystem
  - How well do participating systems integrate?
  - Which interfaces need the most improvement?
  - What areas of the interface deserve the most attention?
- What should an interoperability maturity model (IMM) accomplish?
  - Offer gap identification and guidance for improving interoperability
  - Provide a means for measuring interoperability progress in a community
  - Encourage a standards-based interoperability-aware culture with individual and shared roadmaps for improvement
  - Be both descriptive and prescriptive

#### Context-setting Framework Cross-cutting Issues

#### **GWAC Stack and X-Cutting Issues**

OP1-O1, O4, OP3-O1: Governance policy for time, scheduling, time synchronization, time order dependency and sequencing, is specified.

OP1-O6, O7: Time, scheduling, time synchronization, time order dependency, and sequencing requirements and mechanisms are specified to support the business processes.

OP5-O6, O7: Performance and reliability expectations are specified consistent with the business processes supported across interface boundaries.

### SG-IMM Pocket Reference

# GWAC SG IMM Team

- Stephan Amsbary, EnerNex
- Rik Drummond, Drummond Group
- Tony Giroti, Bridge Energy Group
- Doug Houseman, EnerNex
- Mark Knight, CGI
- Alex Levinson, Lockheed Martin
- Wayne Longcore, SAP
- Randy Lowe, American Electric Power Service Corp
- James Mater, QualityLogic
- Austin Montgomery, Software Engineering Institute CMU
- Terry Oliver, Bonneville Power Administration
- Phil Slack, Florida Power & Light
- Andreas Tolk, Old Dominion University
