

New Architectures for Interacting with Demand Side Resources in Ancillary Services Markets

Ed Koch – Akuacom/Honeywell Sirajul Chowdhury, CAISO John Hernandez, PG&E

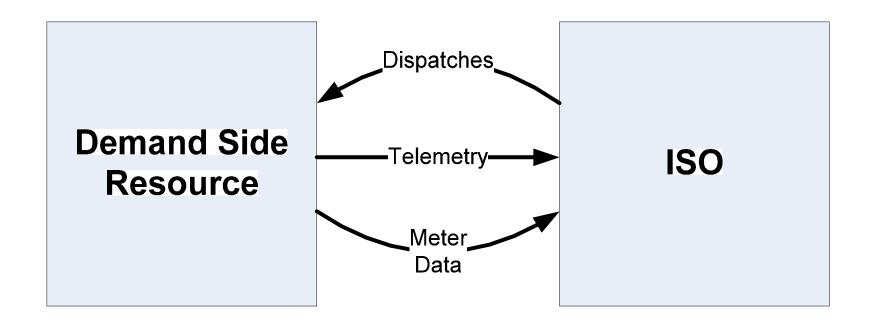

Agenda

- Current scenarios
- Issues
- Possible solutions
- Pilots with alternate architectures

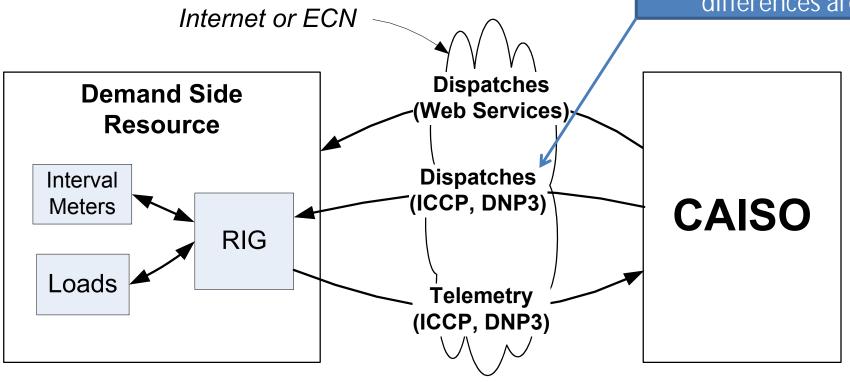

Demand Side Resource Interactions

Current CAISO Interactions

On the middle "dispatches," please put AGC so there is some clarity on what the differences are

Issues with Existing Interactions

- All interactions are directly between CAISO and resources – little allowance for intermediaries
- Requirements for interactions are fairly prescriptive and do not allow for lower cost alternatives (e.g. ECN)
- Requirements tend to be one size fits all and are geared towards traditional generation resources

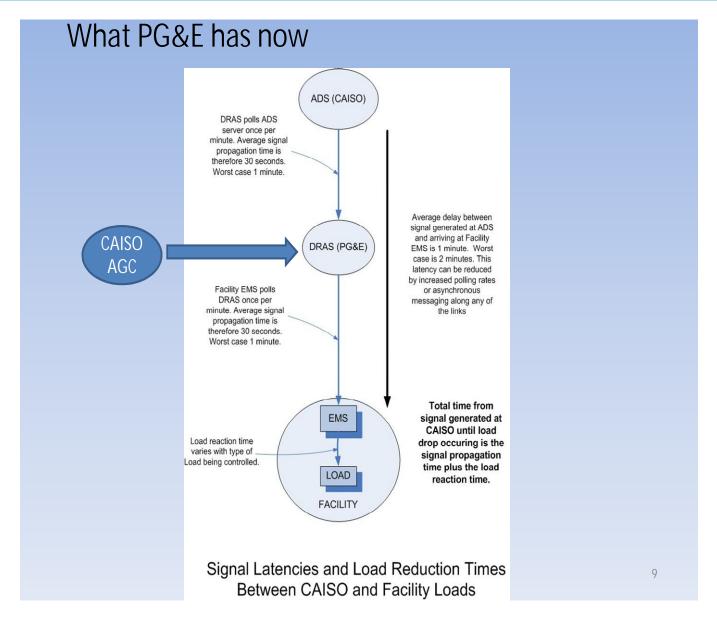

Possible Solutions

- Allow for hierarchical interactions (e.g. intermediaries – data concentrators and aggregators)
- Create requirements that are less prescriptive, but still satisfy the core objectives of the requirements
- Create tiered requirements that are more stringent for larger resources and less stringent for smaller resources

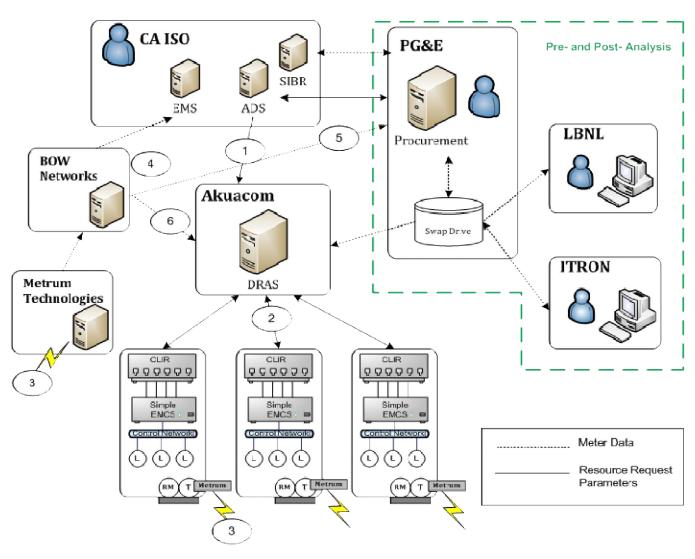

PG&E Pilots with New Architectures

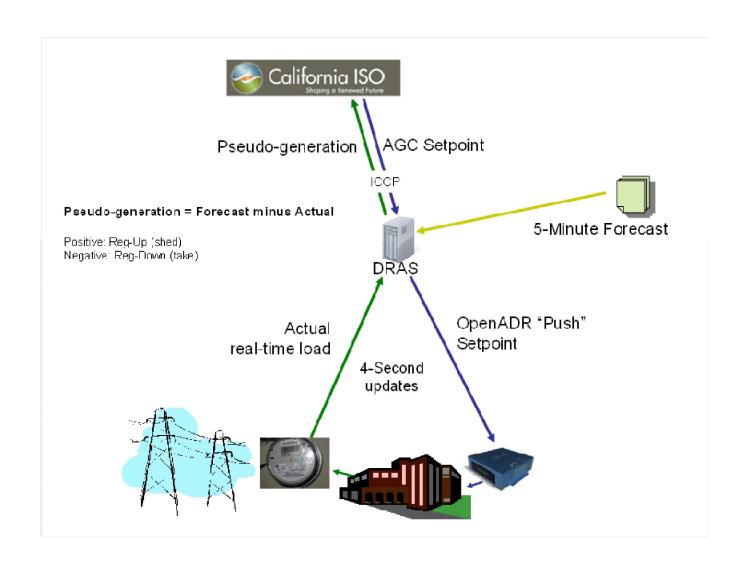

Participating Load Pilot (non-spinning reserves)

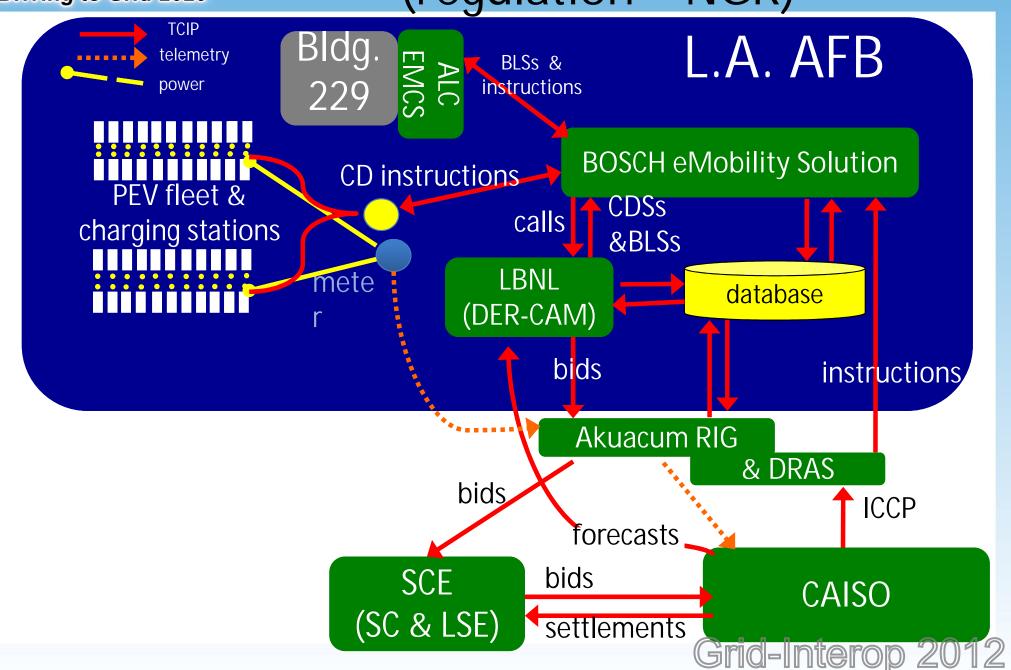

Intermittent Renewable Resource Pilot (regulation)

LAAFB EV Fleet Management (regulation – NGR)

Ongoing Efforts

- CAISO workshops on new architectures for Ancillary Services Metering and Telemetry
 - Data concentration and aggregation
- Research/pilots into lower cost telemetry technologies and options
- Requirements for Ancillary Services support being addressed in OpenADR 2.0
 - Ancillary Services Signal support
 - Lower latency transport mechanisms
 - Specifications to support telemetry
- PAP 19 Wholesale market DR
 - Mappings to OpenADR 2.0
